Standardized Tutoring Execution Process

A structured, high-impact tutoring model that ensures every student continues receiving top-tier education while building confidence, problem-solving skills, and leadership abilities.

1. Prepare – "Know Before You Go"

🎯 Goal:

Enter every session fully equipped. No guesswork. No improvising. A well-prepared tutor inspires trust, delivers more value, and uses time efficiently.

✅ Pre-Session Checklist:

1. Review Past Data

- Open the student's Tracker.
- Check their last few Boss Battles or Learning Notes.
- Look for:
  - Topics frequently missed
  - Confidence dips
  - Skills that haven't been reinforced in the last 2 weeks (non applicable to fresh-mans)

2. Identify the Session Objective

- Define what the student should achieve by the end of the session.
- Choose one clear objective or skill to focus on (e.g. multiplying fractions, exponents, long division).
- Label it like a mini-quest:

  "Today's mission: ...."

3. Prepare Your Teaching Tools

- Write out your example problems beforehand.
- Keep secondary backup problems ready.
- Check your gooseneck camera setup: clean workspace, good lighting, centered view.
- Trackers ready:
  - Solutions Unlocked (lesson/concept comprehension and successful 3 layer applications)
  - Challenges Conquered (challenges bounced back from)Topics frequently missed
  - Boss Battles (tough, challenging problems solved)

4. Mentally Rehearse the Explanation

- Think: "How would I explain this to my younger self or a 6-year old?"
- Break it into 3-5 micro-steps and write them down.
- Anticipate common mistakes.
- Optional: Add a metaphor or memory trick to make it stick.

5. Plan a Warm Opening

- Start with confidence:

  "Last week you did great on ___. Today, we're going to conquer ___."
- Use a compliment or small question to connect with your student personally.

🔒 Why This Step is Bulletproof:

- Saves time & avoids confusion during the session.
- Builds the student's confidence from the very beginning.
- Makes you look and feel like a pro.
- Helps the rest of the session flow easily.

KPI:

- Tutor enters with 1 clear mission/skill pre-planned
- Trackers are opened and reviewed before session starts

- Backup problems and metaphors written out

Checklist:

✅ Reviewed last Boss Battle + tracker notes

✅ Identified today's skill + goal

✅ Wrote 2-3 example problems + 1 bonus

✅ Rehearsed explanation mentally (3-5 micro-steps)

✅ Setup environment + camera + workspace

✅ Planned a confidence-boosting opening

---

2. Model, Apply & Guide – "Show. Don't Just Tell."

🎯 Goal:

Deliver an engaging, clear, and step-by-step teaching experience. Your job is to **teach by doing**, **guide by asking**, and help the student **build confidence while learning the process by letting them lead**.

---

1. Start with Visual Demonstration

- Use the **Gooseneck Camera Setup** to work through the problem in real time.
- Speak your thought process aloud:

  "First, I.... Then, I..."
- Write cleanly and narrate each step in the method - slow enough for them to follow.

2. Use the "Model-Apply-then-Guide" Loop

- Step 1 (Model it): *You solve an example out loud, using the step-by-step method you just narrated.*
- Step 2: Make the student do it (Apply it): *They try a similar problem using the same step-by-step method with your support.*
- Step 3: *You (Guide them) and correct them as needed.*

T/N: it's important to implement written step-by-step methods. Students memorize steps, which is crucial and helps them address any problem, no matter how difficult. As long as their reasoning capacity is always good, they know the rules and remember the steps. They'll experience a great boost of confidence.

We call this the Ready, Fire, Aim approach (from T Harv's book, Secrets of The Millionaire Mind)

1. Model it for the student. - get them "Ready", show them how to use the method.

2. Make the student Apply the method. - let the student "Fire" - do it, attempt it.

3. Lead the student to use their mistakes to Guide them. - Help them "Aim" and lock in accuracy.

3. Key Check-Ins

- Ask things like: after every move in each step
  - *"Can you explain why I did that?"*
  - *"What do you think happens next?"*
- This keeps them mentally invested and engaged

4. Teach in the 3 Layers

- Break the concept into bite-size chunks: The 3 Layer Lens
  - Vocabulary (What's this called?)
  - Method (How do we solve it?) step by step
  - Reasoning (Why does it work?)

    you're building a lawyer who should defend every statement with a valid reason (see how you can make the student tie math to real life?)
- After the student masters all 3 layers of the lesson, track it down as/under "Solutions Unlocked".

- To test and strengthen the third layer (Reasoning), the student should be able to answer any “Why?” asked by the tutor.

5. Boss Battles

- After a bit more practice (the 3 layers are fully grasped by the student), implement a Boss Battle challenge of a hard or advanced difficult problem and record each successful battle into the Battle log.

🔒 Why This Step is Bulletproof:

- Visual and Model teaching = stronger memory retention.
- The student doesn’t just *see* the skill - they begin to *own* it.
- The looped structure means they’re *never passive*.
- Confidence grows because the tutor is right there guiding without pressure or spoon-feeding and tracking growth. Practice makes perfect is a lie, we believe practice makes improvement.
- Lawyer personality breeds a problem-solver identity (that’s how students fall in love with math).
- Progress is data, not a feeling. Every solution they unlock, mentally - they just unlocked a new superpower, making them crave to get as strong as possible through unlocking more solutions.
- It’s hard to make mistakes with the 3 Layer Lens (hack of A math students).

KPI:

- Student successfully applies the method with 80% accuracy after being shown
- Student can identify which step they struggled with using 3-Layer Lens
- At least 1 Boss Battle issued per session

Checklist:

✅ Modeled example clearly, narrating steps

✅ Let student attempt similar problem(s)

✅ Guided corrections using 3-Layer lens

✅ Asked 2–3 engagement check-ins ("Why did I do that?" or "What's next?")

✅ Highlighted success verbally: "That method is yours now."

---

3. Reflect & Correct – "Fix It to Master It."

🎯 Goal:

Use mistakes as moments of learning. Make the student feel safe to mess up - then use the mess to build mastery.

✅ Correction Framework:

1. Let Them Explain First (Teach-Back Method)

- Ask:
  - *"Tell me what you did here."*
  - *"Walk me through your thought process."*
- Don't jump in to fix immediately - let them reflect and verbalize through the 3 Layer lens.
- If they then realize they didn't approach it properly or have a "*Wait a minute, ohhh I see now...*" moment, let them go again e.g "*Oh please, show me rather than telling how you could've done things differently.*"

2. Reinforce the 3 layers.

- Fix the mistake *with* them, not *for* them.
- Re-do the problem side-by-side, asking:
  - *"What could we do differently here?"*
  - *"Where did things go off track?"*
  - *" Where did we make a mistake in our method?'*
- Use arrows, symbols, colors, or highlights to show the difference clearly.

3. Celebrate the Recovery

- Say things like:
  - *"See? That's growth right there."*
  - *"Now you really understand it."*

    - *“Now we can record this moment under Challenges Bounced Back From*
- Frame the mistake as part of the mission:

  “This is where most students get stuck. But not you anymore.”

4. Record Learning Notes

- Add a note in your Challenge Tracker:
    - What was misunderstood?
    - What correction helped?
    - What should be reinforced next time?

🔒 Why This Step is Bulletproof:

- It normalizes making mistakes and **replaces shame with strategy**.
- Students reflect, correct, and build deeper understanding.
- Encourages metacognition - thinking about how they think.
- Creates emotional safety, which increases retention and effort.

KPI:

- Student verbalizes mistake using 3-Layer Lens
- Tutor logs learning correction in Challenge Tracker
- Student shows 1 visible “aha” moment

Checklist:

✅ Used Teach-Back: "Walk me through your process."

✅ Identified error layer: Vocabulary / Method / Reason

✅ Corrected side-by-side (not just told the answer)

✅ Celebrated bounce-back moment

✅ Logged learning notes in tracker

🟦 4. Reinforce & Grow – “Drill It. Track It. Win.”

🎯 Goal:

End the session with momentum. Reinforce the skill. Track performance. Celebrate wins. Prep next week's move.

Reinforcement = Retention. Tracking = Transformation.

✅ Post-Session Routine (Every Session)

1. Assign a Boss Battle

- Choose a **challenge problem** based on the day's skill - not a copy, but a remix.
- Deliver it as a mini-test:

  "This is a Boss Battle. No help. Let's see if it's impossible to be solved one go using the deadly method we just learned"
- If they complete it:
  - ✅ **Win**: Celebrate and move forward.
  - ❌ **Struggle**: Note the pattern → **Reflect & Correct** then loop it back into next week's plan.

---

2. Update the Boss Battle Log

- Log the Boss Battle results with these details:
  - Topic/Skill
  - Level of difficulty
  - Score or completion status
  - Notes on errors or progress
- Add a confidence score if possible (1–5).

📓 *"TT tutors never guess - they track. Data builds decisions."*

---

3. Motivate & Close Strong

- Give one **specific piece of praise**:
  - *"You asked the right questions today - that's elite learning."*

- Leave them with **momentum**:
  - *“Next week we level up. This is where it gets fun. I’m so proud of you.”*

KPI:

- Boss Battle completed and tracked (win or rematch)
- Confidence rating added (1–5 scale)
- Next session direction clearly mapped out

Checklist:

✅ Assigned 1 new Boss Battle (based on session skill)

✅ Updated Challenge + Boss Battle Trackers

✅ Logged: topic, difficulty, win/loss, confidence score

✅ Reinforced with motivational praise

✅ Set goal for next session: 🚀Advance / 🔁Reinforce

🔠 LEXICON SNAP-IN

Embed these phrases across tutor culture:

Phrase	Meaning
“Boss Battle”	A challenge task that tests full understanding
“Solutions Unlocked”	A concept or skill fully mastered
“3-Layer Lens”	The core diagnostic + teaching framework
“Model → Apply → Guide”	TT’s tutoring loop system
“Growth over perfection”	Culture standard
“Progress is data”	Why we track everything
